

Future upgrades

Where we are today. Construction Runner already runs a site day to day: phone sign-in that knows when someone is on site (and signs them out when they leave), inductions, RAMS and briefing sign-off, near-miss reporting, tasks, deliveries, assets, messaging and subcontractor onboarding – with a web dashboard for the office.

That puts us level with the main UK competitors. The upgrades below are about moving **ahead** of them.

The big idea

Most site apps are digital paperwork: they record that something was signed. Construction Runner already knows three things paperwork apps don't:

Where people are

Live site sign-in and sign-out

What they're qualified for

Cards and certificates with expiry dates

What they've read

Inductions, RAMS and briefings

Every upgrade below plugs into those three, so the app doesn't just store records – **it notices when something is wrong and tells someone.**

The upgrades

1. Prove workers understood, not just signed

After reading a RAMS or toolbox talk, the worker answers 3 quick questions generated from that exact document. Different questions each time; a bad question is pulled automatically if too many people get it wrong.

Why it matters: a signature proves someone tapped "I agree". This proves they understood – much stronger evidence for clients, insurers and the HSE. No UK competitor combines this with live site sign-in.

2. Permits that know where, who and when

Digital permit-to-work (hot works, height, confined space, excavation, isolations), but smarter:

- Only people with **valid qualifications** can be added to a permit
- If the person who issued the permit **leaves site**, the permit is suspended automatically
- Permits are drawn on a **site map**, with warnings when two clash (e.g. hot works next to a confined space)
- **Fire-watch countdown** after hot works, with reminders and a closing photo

3. Visitors with no iPad and no blind spots

- A **QR poster** at the gate – visitors sign in on their own phone. No kiosk to buy.
- Every visitor is **linked to a host**; if the host leaves, they're reminded their visitor is still on site
- Visitors appear in the **fire roll-call** alongside workers
- Delivery drivers are **matched to their booked slot** automatically

4. CSCS cards that stay checked

- Scan a card once; the app **tracks expiry** and reminds the worker before it lapses
- Shows **who is on site today without the qualifications their job needs**
- Flags suspicious cards (same card on two people, expired card presented)

5. Works with no signal

Finish offline sign-in and sign-out so workers on sites with poor signal are still recorded accurately, and everything syncs when they reconnect.

Suggested order

Step	Upgrade	Why this order
1	Offline sign-in fix	Reliability of what customers already use
2	CSCS cards that stay checked	Quick win; permits depend on it
3	Understanding checks on RAMS & briefings	Our headline difference
4	Visitor QR sign-in	High demand from buyers
5	Smart permits	Builds on steps 2 and 3

IN ONE LINE

Construction Runner already runs the site. Next, it proves the right people are in the right place, qualified and briefed – and speaks up when they're not.
